UNIVERSAL HEAVY DUTY LICENCE PLATE
LIGHT BRACKET (W/LED)
## 1557

Kit Contents:

Item	Qty
License Plate Light Bracket	1

Installation Instructions:

1. First attach 3 LED License Plate light to License Plate Bracket. Begin by passing the wires for the light through the oval slot in the middle of the bracket.

2. Position the 3 LED License Plate light against the mounting tab as shown with the wires facing away from the tab and align the holes of the light with the corresponding holes in the tab. (The curved edges of the light will be against the tab, and the sharp edges will be away from the tab.) Secure the light to the tab with the included #6 sheet metal screws.

3. Mount License Plate with Light Bracket positioned behind the plate. The Light Bracket holes will align with the mounting holes already in the license plate. Re-use your existing License Plate mounting hardware, or choose the appropriate hardware type for your application.

4. This kit is universal so although guidelines are given, it is ultimately your responsibility to determine the best method to power the light. Using your preferred method, connect the power wires for the LED light to your existing license plate light wires. If you do not have existing wires, you can splice into a tail-light circuit or locate a wire that energized when the marker lights are turned on. For most applications, connect the White wire of the LED light to a (+) Positive source, and connect the Black wire to a (-) Negative (or ground). **Please note that LED's are polarity sensitive and must be connected correctly. In some cases the black and white wires may be switched (i.e. the black wire is positive)…If your LED's do not light up, try reversing the wire connections.**
